

PLATFORM OVERVIEW

DURABILITY BELONGS IN YOUR CODE

NOT AROUND IT.

Your agent doesn't just need to work—it needs to keep improving. The effort required to make both true shouldn't require separate infrastructure.

Inngest is agent infrastructure that lives in your codebase.

Write logic as functions to automate retries, control flow, and unlock full observability by default. Inngest captures inputs, outputs, and state at every step automatically.

Inngest works for any code, on any runtime, in serverless or traditional environments. One engine for your entire agent life cycle—from background jobs to agent evals—all in one place.

Trusted in Production by

Core Capabilities

Inngest is agent infrastructure, without the infrastructure.

Durability

- **Retries:** Retry without rerunning.
- **Flow control:** Concurrency in code.
- **State:** Pause & resume as needed.

Observability

- **Metrics:** Throughput, failures, latency.
- **Traces:** Every execution logged.
- **Insights:** What happened, and why.

Optimization

- **Scoring:** Evaluate outputs.
- **Experiments:** A/B test in prod.
- **Evals:** Persistent scoring across runs.

Use cases

From queues done right to full agent observability

AI AGENTS

Pause and resume for human-in-the-loop handoffs.

WORKFLOWS

Branch, fan out, and coordinate complex logic in code.

SCHEDULES

Define cron jobs in code, not config. Auto-recover runs.

EVENTS & WEBHOOKS

Trigger one or many functions from a single inbound event.

API ENDPOINTS

Wrap any HTTP handler in durable execution.

SERVERLESS

Step state persists across invocations.

BACKGROUND JOBS

Offload long-running work from the request cycle.

QUEUES

Replace SQS or BullMQ with functions that carry logic.

How it Works

Inngest is agent infrastructure, without the infrastructure.

- 1 Install & Serve**
Add the SDK to your project and expose a single HTTP endpoint. Inngest auto-discovers functions on deploy.
- 2 Write Your First Function**
Define functions with `createFunction()`. Each `step.run()` checkpoints and retries automatically.
- 3 Dev Locally, Deploy Anywhere**
Deploy the Inngest Dev Server to the Cloud or your own infra. Replay failures, and score outcomes instantly.

SDK primitives

The same building blocks across every use case

step.run() Atomic checkpoint. Retries independently, result cached on success.	step.sleep() Suspend for any duration. Zero compute held while waiting.	step.sleepUntil() Pause until a specific date and time, then resume automatically.	step.waitForEvent() Pause until a matching event arrives from any source.	step.waitForSignal() Pause until a direct signal is sent via SDK or API.
step.invoke Call another function as a step. Waits for result, no compute burned.	step.sendEvent() Fire and forget dispatch. Triggers other functions asynchronously.	NEW step.defer() Schedule a step to run later without blocking execution.	NEW step.score() Evaluate and record output quality on any step.	NEW group.experiments() A/B test variants in production with built-in analysis.
